

Alongside Design Plugin — Customization & Install Guide

This package bends the **design** plugin's seven skills toward your `ALONGSIDE_UIUX_ThemeSystem.pdf` bible and your real stack (no Figma; Asana + TickTick; no AI imagery; ethics-first). It also flags which past artifacts should be brought up to the bible.

Why this couldn't be auto-packaged here

The official customizer edits the live plugin at `mnt/.local-plugins` and repackages a `.plugin` file — but that only works in the **desktop Cowork app**. This chat is the web/mobile interface, where those plugin directories aren't mounted (I can only see the read-only reference copies). So instead of a half-working package, this is the finished content, ready to drop in.

Two ways to apply it:

1. **Easiest — in Cowork desktop:** open a Cowork session and say "*customize the design plugin*" with this folder attached. It'll place the files and build the `.plugin` for you.
2. **Manual:** copy the files into the plugin (paths below).

Where each file goes

The design plugin's skills live one-per-folder as `SKILL.md`. Replace the body of each with the matching file here (keep each skill's original `name:` — I did).

This file	Replaces
<code>CONNECTORS.md</code>	the plugin-root <code>CONNECTORS.md</code> (the shared file every skill's header points to). If it doesn't exist yet, create it at the plugin root.
<code>skills/design-critique.md</code>	<code>design:design-critique/SKILL.md</code>
<code>skills/design-system.md</code>	<code>design:design-system/SKILL.md</code>
<code>skills/accessibility-review.md</code>	<code>design:accessibility-review/SKILL.md</code>

This file	Replaces
skills/ux-copy.md	design:ux-copy/SKILL.md
skills/design-handoff.md	design:design-handoff/SKILL.md
skills/user-research.md	design:user-research/SKILL.md
skills/research-synthesis.md	design:research-synthesis/SKILL.md

Keep `ALONGSIDE_UIUX_ThemeSystem.pdf` alongside the plugin (or in the project) so the skills can reference it by name.

What changed, in plain terms

1. **The bible is now the source of truth.** Every skill measures against your philosophy, laws, ADHD rules, card logic, token contract, theme library, and quality floor instead of generic taste. No re-deriving that research per app.
2. **Figma is gone.** Skills inspect the actual artifact code + a screenshot, because that's how you build.
3. **Connectors are your real ones.** Asana for business apps, TickTick for the daily hub (created directly, no confirmation; with the Academy "Arrange Tasks" gotcha flagged). No fake analytics/feedback connectors.
4. **Your non-negotiables are baked in.** No AI imagery; avoid the three AI-default looks; never shaming; accessibility floor; externalize time; honest evidence; ethics/privacy/local-ownership by default.
5. **Your brand voices are in the copy skill.** Foxhole field-manual vs. OrcaTeknic telemetry, plus the Spanish automotive-glossary flag.
6. **Research ethics = data minimization.** Consent, anonymization, owned storage, auto-purge — same posture as the Translation SaaS.

Artifacts to bring up to the bible (your flag list)

Per your request — here's everything we've built that predates the bible, with whether it needs work. Do these in the relevant project chats so context stays put.

Worth a conformance pass

- **Animated end-card** (Foxhole / OrcaTeknic / Unified, toggleable skins). Built before the token contract. *Flag*: check it against \$5 tokens, \$8 motion (<400ms, reduced-motion), and confirm the OrcaTeknic skin maps cleanly to Reef Night / Spectrum. Run `/design-system audit` + `/accessibility-review`.
- **OBS overlay suite** (9 OrcaTeknic + Foxhole HTML browser sources). These are broadcast overlays, not app UI, so the *app* rules apply loosely — but the token/color discipline and reduced-motion floor still help. *Flag*: light audit; align palettes to the locked theme values where practical.
- **StreamElements chat widget** (transmission-log style). *Flag*: contrast pass on the timestamp/role-badge text over its background (\$5 `--soft`-type pairs).

Bible-adjacent, low priority

- **Wrench cursor set** (.cur/.ani/PNG). Visual signature asset, not UI — no token work needed. Already on-palette (field olive/rust/cream). Leave as is.
- **OpenSCAD button box**. Physical/parametric, outside the design system. No action.

Not design-system artifacts (no action)

- TickTick/Asana project structures, the funding one-pager PDF, sound-design guide, legal/attorney docs. These aren't UI; the bible doesn't govern them (though the *copy* skill's voice rules can help the one-pager if you revisit it).

When you build the actual apps (THE APP, Academy landing, Translation SaaS)

Start each build chat by loading the bible, pick a theme via the \$7 matrix, and the customized skills will hold you to it from the first screen. Nothing to retrofit — they'll be born conformant.
